Today's advisory emails will be the last for this season.

Typical cool nighttime temperatures are unfavorable for leaf spot development.

Advisories still show a high risk of Sclerotinia blight in most areas, but we see very little benefit from Sclerotinia sprays made this late in the season. Unless you plan a very late harvest, it is too late to apply Omega due to its PHI of 30 days.

We will be running disease advisory programs in-house for a few more weeks and can provide updated advisories on request.

If you have comments or suggestions about disease advisories, please give me a call or send an email.

Thanks for your interest in peanut disease advisories. See you next summer!
