

Images of Chemical Burn on Peanuts

Ultra Blazer and 2,4-DB were applied to these peanuts on Monday, June 26. Images were recorded on Thursday, June 29. Some of these spots appear to look like the leaf spot disease that we control with fungicides. Lesions from disease will begin showing much later in the season and will typically start on the lower leaves in the canopy. We will provide more detail in the coming weeks on leaf spot disease.
